2. Asked about the whole trial, GPT spots doctored objects jumping, but never suspects editing

Each request shows every snapshot of one trial, all three cameras (blurred and doctored: 60 trials; unaltered: 12). Asked directly: “Does any object on the table change position or size between snapshots in a way that is not explained by the robot touching or moving it?” Mentions it unprompted: reports such movement when asked only to describe how each object’s position changes. Unprompted reports, and edit suggestions in either answer, coded by GPT-6 Astra.
